

1 Power Spectrum

We divide the power spectrum this way:

$$P(k, a) = P_{\text{ad}}(k, a) + P_{\text{iso}}(k, a) \quad (1)$$

where:

•

$$P_{\text{ad}}(k, a) = 2\pi^2 A_s \frac{k^{n_s} c^{n_s+3}}{H_0^{n_s+3}} T^2(k) \left(\frac{D(a)}{D(a=1)} \right)^2 \quad (2)$$

The growth factor in a universe with matter and dark energy is:

$$\begin{aligned} D(a) &= \frac{5\Omega_m}{2} \frac{H(a)}{H_0} \int_0^a \frac{da'}{(a'H(a)/H_0)^3} \\ H(a) &= H_0 \left(\frac{\Omega_m}{a^3} + \Omega_\Lambda \right)^{1/2} \end{aligned} \quad (3)$$

By defining:

$$\begin{aligned} \Omega_m(z) &= \frac{\Omega_{m,0}}{\Omega_{\Lambda,0} a^3 + \Omega_{m,0}} \\ \Omega_\Lambda(z) &= \frac{\Omega_{\Lambda,0}}{\Omega_{\Lambda,0} + \Omega_{m,0}/a^3} \end{aligned} \quad (4)$$

we get the following approximation for the growth factor:

$$D(z) = \frac{5\Omega_m(z)}{2} \left(\Omega_m(z)^{-4/7} - \Omega_\Lambda(z) + \left(1 + \frac{\Omega_m(z)}{2} \right) \left(1 + \frac{\Omega_\Lambda(z)}{70} \right) \right)^{-1} \quad (5)$$

The transfer function is well fitted by:

$$T(k) = \frac{\log(1 + 2.34q)}{2.34q} (1 + 3.89q + (16.1q)^2 + (5.46q)^3 + (6.71q)^4)^{-1/4} \quad (6)$$

where:

$$q \equiv \frac{1}{\Gamma} \left(\frac{k}{h \text{ Mpc}^{-1}} \right) \quad \text{and} \quad \Gamma = \Omega_{m,0} h \exp(-\Omega_{b,0}(1 + \sqrt{2h}/\Omega_{m,0})) \quad (7)$$

•

$$P_{\text{iso}}(k, a) = \begin{cases} \frac{(f_{\text{PBH}} \tilde{D}(a))^2}{\bar{n}_{\text{PBH}}} & k < k_{\text{PBH}} \\ 0 & k > k_{\text{PBH}} \end{cases} \quad (8)$$

where $k_{\text{PBH}} = (2\pi^2 \bar{n}_{\text{PBH}}/f_{\text{PBH}})^{1/3}$, $\bar{n}_{\text{PBH}} = f_{\text{PBH}} \frac{3H_0^2}{8\pi G} (\Omega_m - \Omega_b)/m_{\text{PBH}}$ and:

$$\begin{aligned} \tilde{D}(a) &= \left(1 + \frac{3\gamma}{2a_-} s \right)^{a_-} - 1 \quad s = \frac{a}{a_{\text{eq}}} \\ \gamma &= \frac{\Omega_m - \Omega_b}{\Omega_m} \quad a_- = \frac{1}{4}(\sqrt{1 + 24\gamma} - 1) \end{aligned} \quad (9)$$

2 Halo Mass Function

The smoothed density variance is:

$$\sigma(R)^2 = \int_0^\infty \frac{dk}{2\pi^2} k^2 P(k) W(k, R)^2 \quad (10)$$

The window function is taken to be gaussian:

$$W(x, R) = \frac{1}{(2\pi)^{3/2} R^3} \exp(-x^2/2R^2) \quad (11)$$

with a Fourier transform:

$$W(k, R) = \exp(-k^2 R^2/2) \quad (12)$$

The relationship between the radius R and the mass of the halo is:

$$M(R) = (2\pi)^{3/2} R^3 \bar{\rho} \quad \bar{\rho} = \rho_{\text{crit},0} \cdot \Omega_m \quad (13)$$

therefore:

$$W(k, M)^2 = \exp\left(-\frac{k^2}{2\pi} \left(\frac{M}{\bar{\rho}}\right)^{2/3}\right) \quad (14)$$

Finally the halo mass function is, considering ellipsoidal dynamics with Sheth-Tormen:

$$\frac{dn}{dM} = -A \sqrt{\frac{2}{\pi}} \sqrt{a} \nu \exp(-a\nu^2/2) (1 + (a\nu^2)^{-p}) \frac{\bar{\rho}}{M^2} \frac{d \log(\sigma(M))}{d \log(M)} \quad (15)$$

with $\nu = \frac{\delta_c}{\sigma(M)}$ and:

$$A = 0.32 \quad a = 0.75 \quad p = 0.3 \quad (16)$$

.We can rewrite it as:

$$\begin{aligned} \frac{dn}{dM} &= -\sqrt{\frac{2}{\pi}} \frac{\delta_c}{\sigma} \exp\left(-\frac{a\delta_c^2}{2\sigma^2}\right) (1 + (a\nu^2)^{-p}) \frac{\bar{\rho}}{M^2} \frac{d \log(\sigma(M))}{d \log(M)} \\ &= -\sqrt{\frac{2}{\pi}} \frac{\delta_c}{\sigma} \exp\left(-\frac{a\delta_c^2}{2\sigma^2}\right) (1 + (a\nu^2)^{-p}) \frac{\bar{\rho}}{M^2} \frac{M}{\sigma} \frac{d\sigma(M)}{dM} \\ &= -\sqrt{\frac{2}{\pi}} \frac{\delta_c}{\sigma^2} \exp\left(-\frac{a\delta_c^2}{2\sigma^2}\right) (1 + (a\nu^2)^{-p}) \frac{\bar{\rho}}{M} \frac{d\sigma(M)}{dM} \\ &= -\sqrt{\frac{2}{\pi}} \frac{\delta_c}{\sigma^2} \exp\left(-\frac{a\delta_c^2}{2\sigma^2}\right) (1 + (a\nu^2)^{-p}) \frac{\bar{\rho}}{M} \frac{1}{2\sigma} \frac{d(\sigma(M)^2)}{dM} \\ &= -\sqrt{\frac{2}{\pi}} \frac{\delta_c}{\sigma^3} \exp\left(-\frac{a\delta_c^2}{2\sigma^2}\right) (1 + (a\nu^2)^{-p}) \frac{\bar{\rho}}{M} \frac{1}{2} \frac{d(\sigma(M)^2)}{dM} \end{aligned} \quad (17)$$

Now, the only dependence on M contained in $\sigma(M)^2$ is in $W(k, M)^2$, which is given by (12). Then:

$$\frac{d(W(k, M)^2)}{dM} = -\frac{k^2}{2\pi} \frac{2}{3} \frac{1}{\bar{\rho}^{2/3} M^{1/3}} W(k, M)^2 \quad (18)$$

Therefore the derivative of $\sigma(M)^2$ is:

$$\frac{d(\sigma(M)^2)}{dM} = -\frac{1}{3} \frac{1}{2\pi} \frac{1}{\bar{\rho}^{2/3}} \frac{1}{M^{1/3}} \int_0^\infty \frac{dk}{\pi^2} k^4 P(k) W(k, M)^2 \quad (19)$$

Putting (16) in (14) we get:

$$\frac{dn}{dM} = \frac{1}{3 \cdot (2\pi)^{3/2}} \frac{\delta_c}{\sigma^3} \frac{\bar{\rho}^{1/3}}{M^{4/3}} \exp\left(-\frac{\delta_c^2}{2\sigma^2}\right) (1 + (a\nu^2)^{-p}) \int_0^\infty \frac{dk}{\pi^2} k^4 P(k) W(k, M)^2 \quad (20)$$

3 Cosmological Parameters

h	0.674
H_0	$100\ h\ km\ s^{-1}\ Mpc^{-1}$
$\rho_{\text{crit},0}$	$1.260 \times 10^{11}\ M_{\odot}\ Mpc^{-3}$
Ω_m	0.315
Ω_{Λ}	0.685
Ω_b	0.049
A_s	2.1×10^{-9}
n_s	0.965
z_{eq}	3402
k_{eq}	$0.015\ h\ Mpc^{-1}$
G	$4.301 \times 10^{-9}\ km^2\ Mpc\ M_{\odot}^{-1}\ s^{-2}$
δ_c	1.686
